

Enhanced Lecture Slides with “Closed Caption” Style Text using Luigi
(Tool and/or maybe a Pset)

Amit R. Gupta

CSCI E-29 Advanced Python for Data Science
Spring 2019
Harvard University Extension School
Prof. Scott Gorlin

The Project

- Convert a lecture or presentation to text, and map the spoken text to each relevant slide
- One can lookup the entire lecture notes at a later point for easy reference, and keyword search
- Example from Scott Gorlin's Monday lecture (08_dask.pdf, slide4)

HOW TO REACH US

Private/DM on Piazza are not reliable!

GROUP PIAZZA

- Group discussions
- Readings, notes, etc
- Brainstorming

INDIVIDUAL CANVAS

- DM for appointments
- Assignment comments
- Grading

Converted Text from Scott's presentation

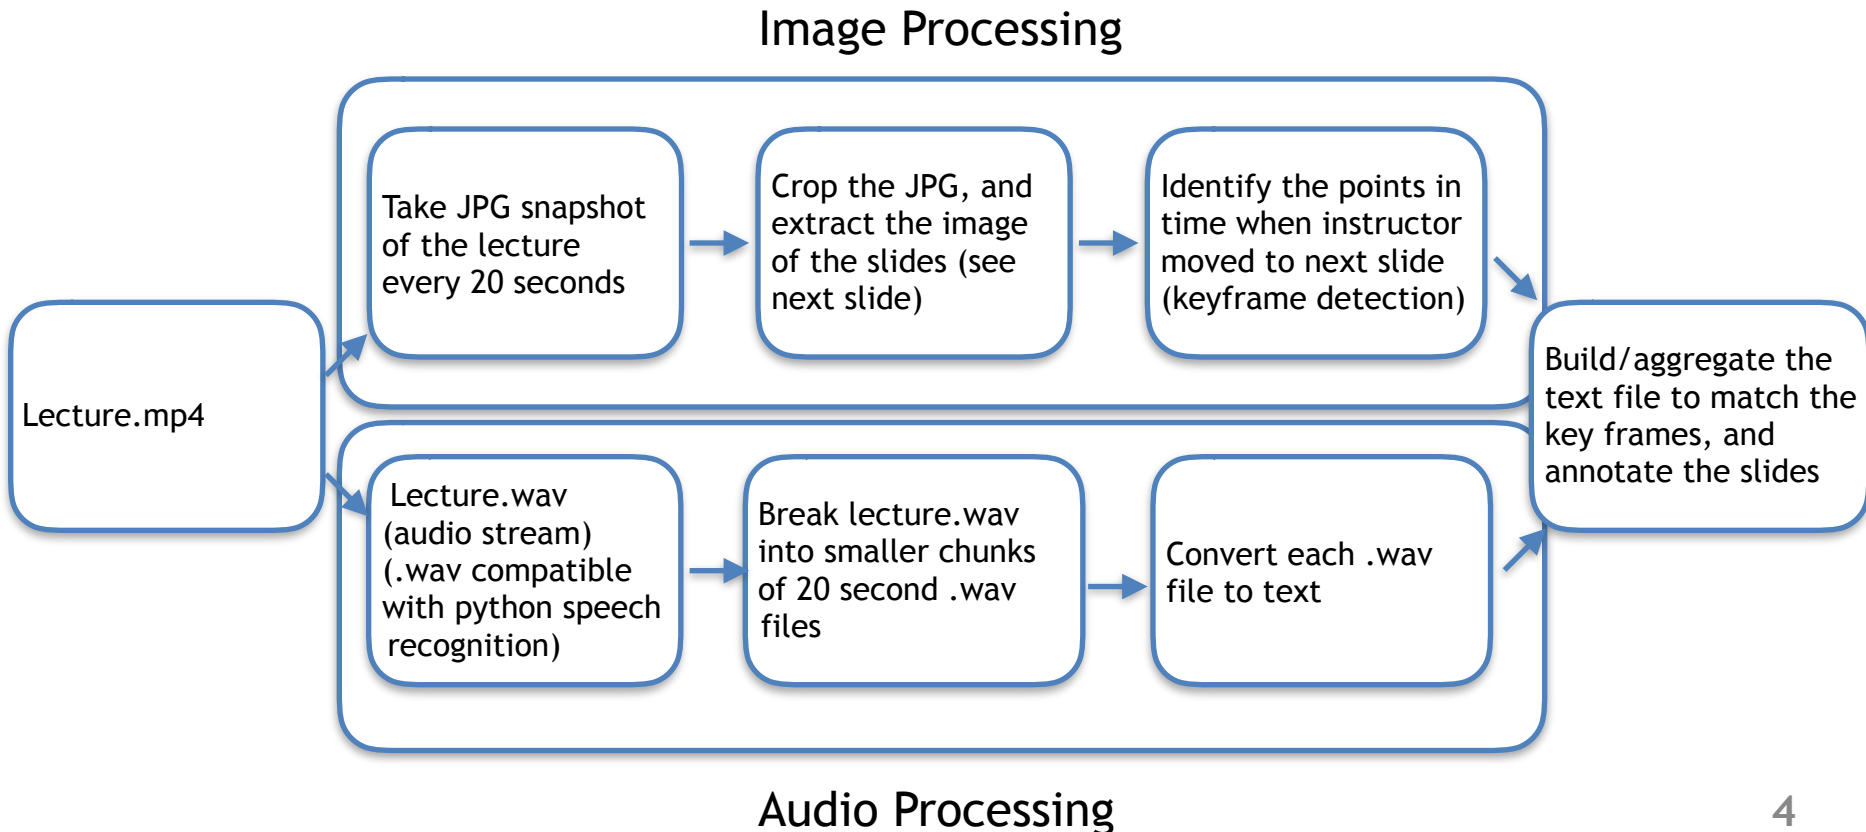

one thing that I wanted to point out is that I think there's been a few misses in terms of communication so Piazza is where we convey as a group and student feedback between each other is Great is that are visible to everyone I think it's working pretty well for that but we haven't been super successful in Direct Communications on on Piazza number post where people try to contact you know a specific TA or they ask for grading feedback and because there's so much stuff on Piazza...

Goal

- Generate annotated lecture slides with speaker/instructor text
- Please see an example of a sample pdf [here](#)

The Flow

- Convert lecture to .mp4 format
- Extract audio and video stream
- Every 20 seconds take a JPG snapshot (downsampling)
- Convert audio to text
- Build Keyframes and map text to each slide

Slide Extraction

JPG snapshot

Extracted slide from the JPG snapshot

4/1 PROPOSALS DUE

Anything you can clearly relate to course material, eg:

- *Contribute* to a popular OSS project
- *Solve a problem from work* and write up a case study
- *Write a problem set* on an exciting topic
- *Write a tool* you wish you had for this course

Proposals (non-binding) due 4/1

Teams OK, so long as we can grade individuals

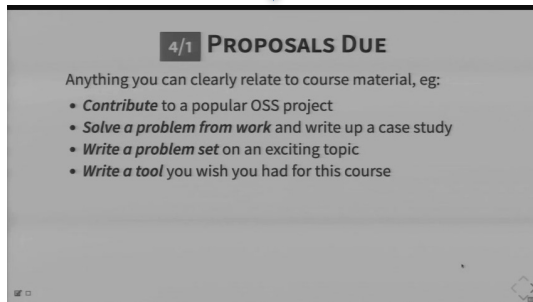

Expected effort approximately 10-20 hours

What is a KeyFrame

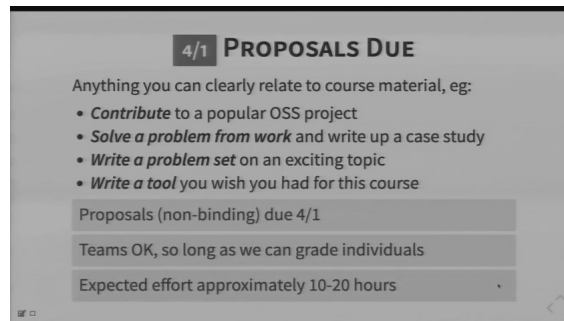

- A KeyFrame is where the 2 JPG snapshots are dissimilar.
- Leveraged a measure called structural similarity index (<http://www.cns.nyu.edu/pub/eero/wang03-reprint.pdf>) (to identify the keyframes)
- KeyFrames are essentially the various complete slides shown in the presentation

Non-KeyFrame

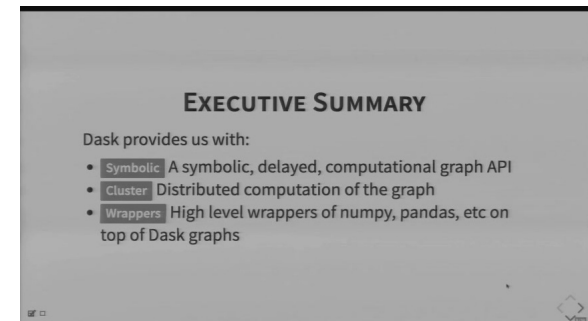

(it is similar to the next snapshot)

KeyFrame

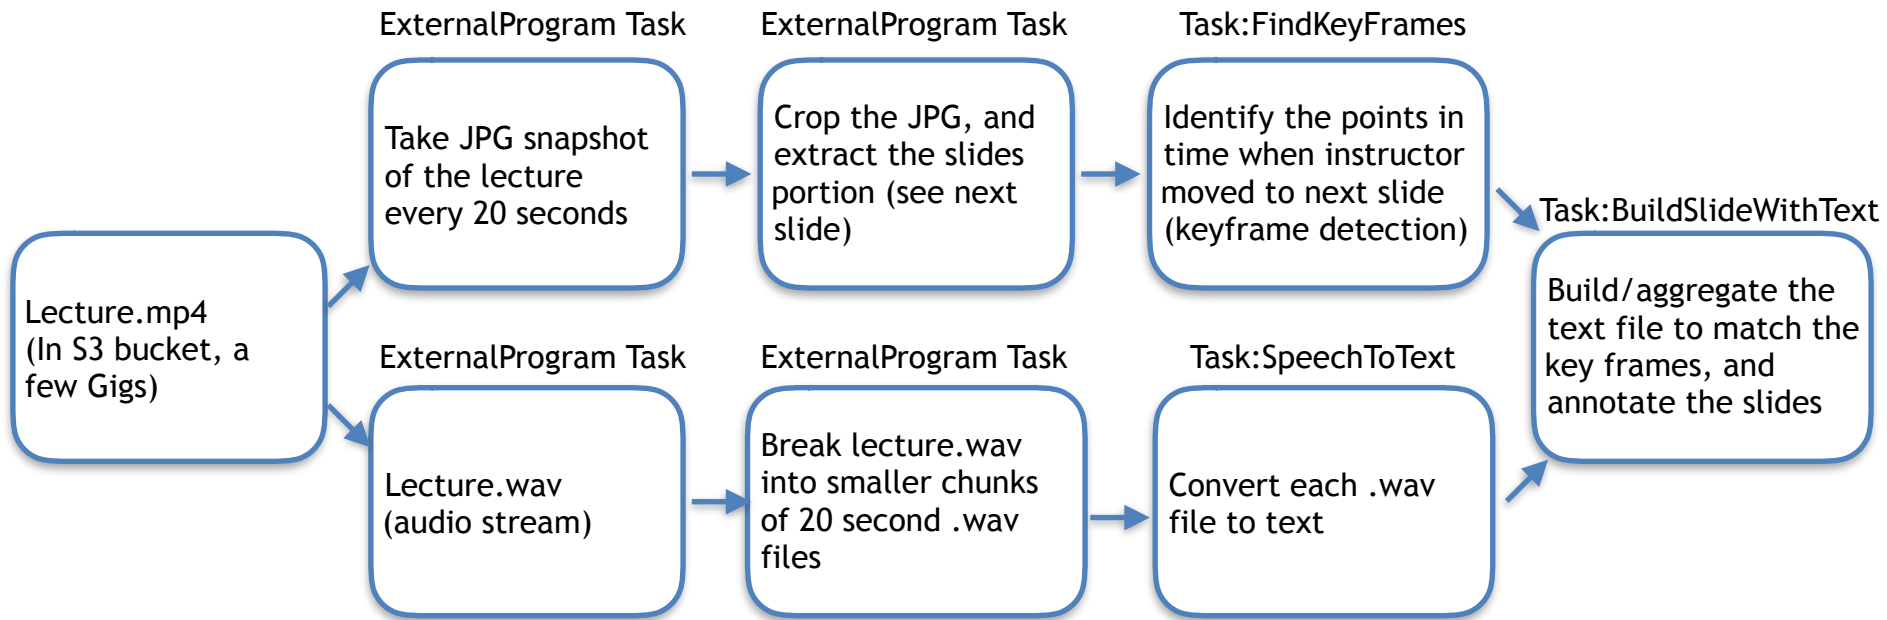

KeyFrame

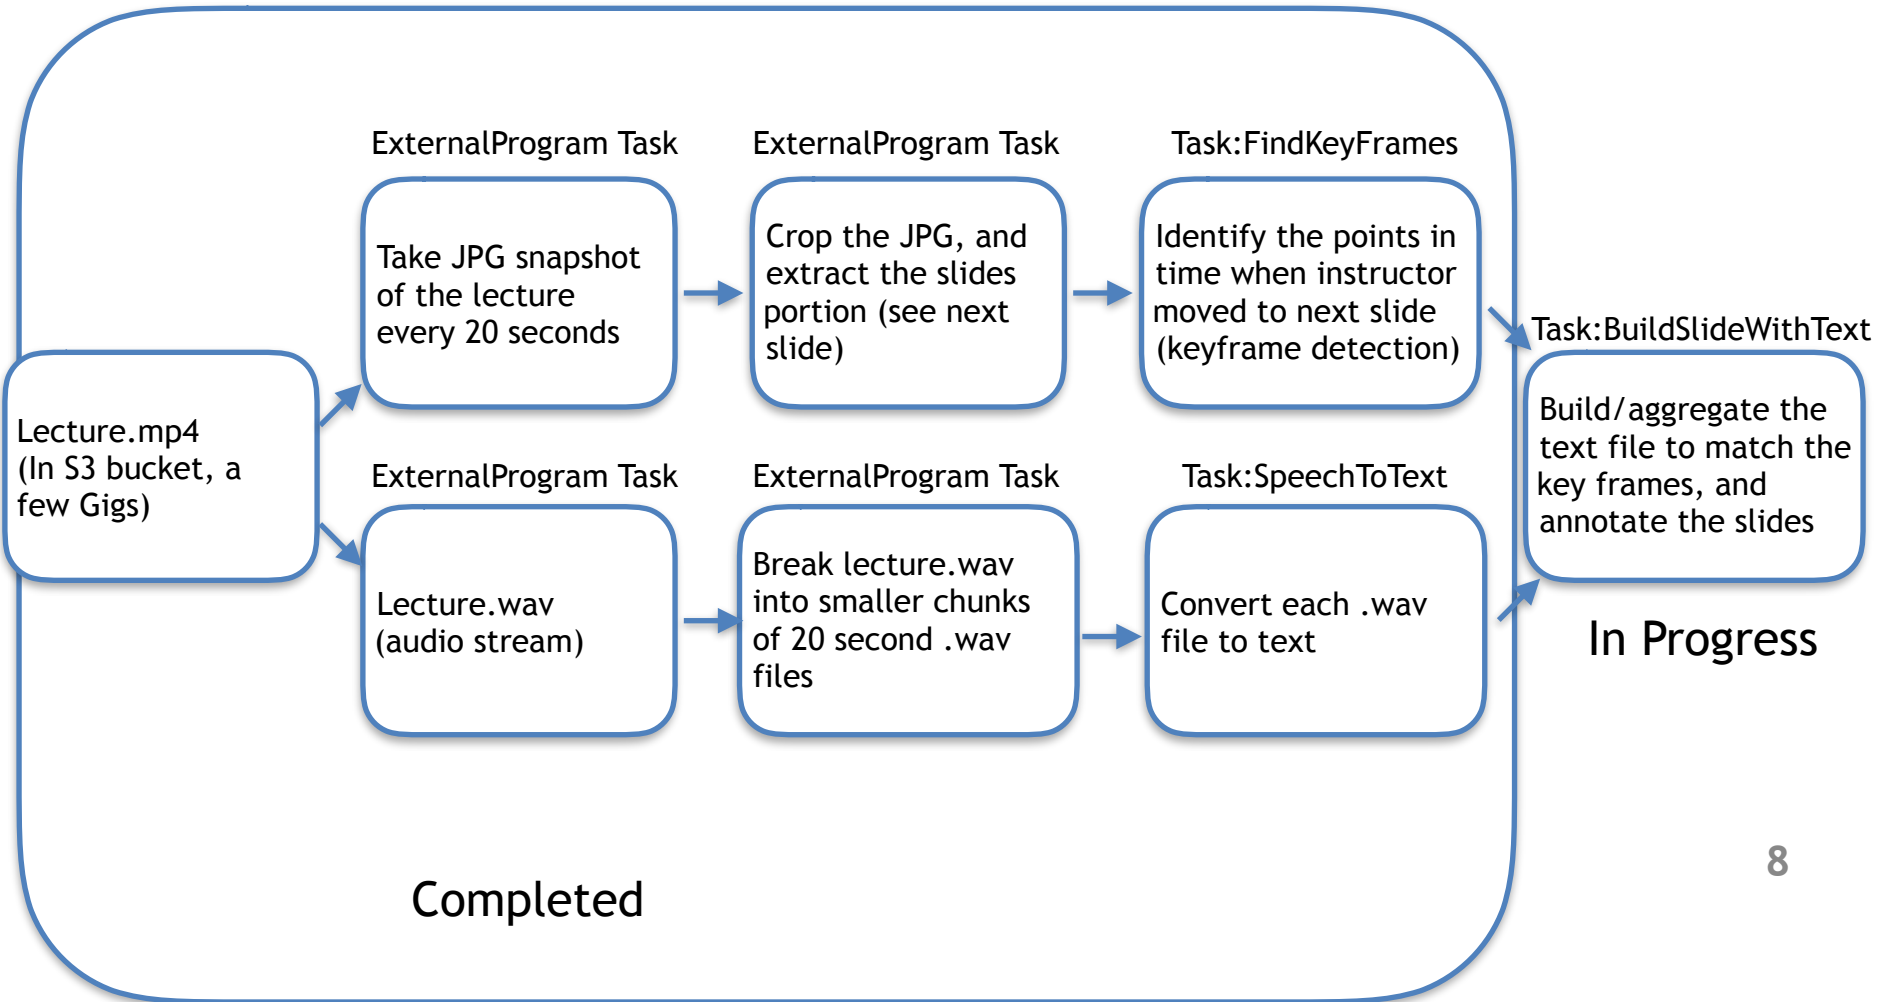

JPG snapshots in time

Mapping “The Flow” to Luigi

Status - Coding Progress

Status and Areas for Improvement

- Status
 - Coding for image and audio processing tasks completed with Luigi framework
 - Final task (build text with slides) coding remains - requires a few iterations to get the algorithm right.
- Future areas of improvement
 - The speech recognition software translates words like Dask to desk, parquet to RK. Essentially the software doesn't recognize technical jargon.
 - The annotated text output in the slides needs to be improved. Right now it is a clutter.

Luigi Challenges

- Number of tasks in the flow are generating a large number (in hundreds) of JPG and WAV files.
- I had to pre-calculate the last snapshots of JPG and WAV files that are generated by FFMPEG, and use these as a dependency into the next task to stay compatible with Luigi's paradigm. (The collections concept like dask targets may have worked better for this specific use case)
- I didn't use the `self.input` and `self.output` in the code given the large number of files needed in each task. In the `run` method, I directly picked the files from the relevant directories.

Packages, and Code

- luigi
- scikit-learn (for ssim - structural similarity index)
- opencv-python (for image cropping and extraction)
- speechrecognition (wavfiles to text)
- cookiecutter template developed for psets was used for this project
- Code checked into <https://github.com/csci-e-29/2019sp-final-project-amitathex>
